

- Jayendra Khatod

# **Objectives**

- Write SELECT statements to access data from more than one table using equality and nonequality joins
- View data that generally does not meet a join condition by using outer joins
- Join a table to itself by using a self join

# **Obtaining Data from Multiple Tables**

#### **EMPLOYEES**

EMPLOYEE_ID	LAST_NAME	DEPARTMENT_ID
100	King	90
101	Kochhar	90
		-
202	Fay	20
205	Higgins	110
206	Gietz	110

#### **DEPARTMENTS**

DEPARTMENT_ID	DEPARTMENT_NAME	LOCATION_ID
10	Administration	1700
20	Marketing	1800
50	Shipping	1500
60	IT	1400
80	Sales	2500
90	Executive	1700
110	Accounting	1700
190	Contracting	1700

EMPLOYEE_ID	DEPARTMENT_ID	DEPARTMENT_NAME
200	10	Administration
201	20	Marketing
202	20	Marketing

102	90	Executive
205	110	Accounting
206	110	Accounting

### **Cartesian Products**

- A Cartesian product is formed when:
  - A join condition is omitted
  - A join condition is invalid
  - All rows in the first table are joined to all rows in the second table
- To avoid a Cartesian product, always include a valid join condition in a WHERE clause.

# **Generating a Cartesian Product**

### EMPLOYEES (20 rows)

EMPLOYEE_ID	LAST_NAME	DEPARTMENT_ID
100	King	90
101	Kochhar	90
202	Fay	20
205	Higgins	110
206	Gietz	110

### **DEPARTMENTS (8 rows)**

DEPARTMENT_ID	DEPARTMENT_NAME	LOCATION_ID
10	Administration	1700
20	Marketing	1800
50	Shipping	1500
60	IT	1400
80	Sales	2500
90	Executive	1700
110	Accounting	1700
190	Contracting	1700

8 rows selected.

Cartesian product: —> 20x8=160 rows

20 rows selected.

EMPLOYEE_ID	DEPARTMENT_ID	LOCATION_ID
100	90	1700
101	90	1700
102	90	1700
103	60	1700
104	60	1700
107	60	1700

# **Types of Joins**

# Oracle Proprietary Joins (8*i* and prior):

- Equijoin
- Non-equijoin
- Outer join
- Self join

**SQL: 1999 Compliant Joins:** 

- Cross joins
- Natural joins
- Using clause
- Full or two sided outer joins
- Arbitrary join conditions for outer joins

# **Joining Tables Using Oracle Syntax**

Use a join to query data from more than one table.

```
SELECT table1.column, table2.column

FROM table1, table2

WHERE table1.column1 = table2.column2;
```

- Write the join condition in the WHERE clause.
- Prefix the column name with the table name when the same column name appears in more than one table.

# What is an Equijoin?

#### **EMPLOYEES**

	EMPLOYEE_ID	DEPARTMENT_ID
6	200	10
7/	201	20
	202	20
	124	50

# **Qualifying Ambiguous Column Names**

- Use table prefixes to qualify column names that are in multiple tables.
- Improve performance by using table prefixes.
- Distinguish columns that have identical names but reside in different tables by using column aliases.

# **Using Table Aliases**

- Simplify queries by using table aliases.
- Improve performance by using table prefixes.

# **Joining More than Two Tables**

#### **EMPLOYEES DEPARTMENTS** LOCATIONS DEPARTMENT ID LOCATION ID LAST NAME DEPARTMENT ID LOCATION ID CITY 10 1700 Southlake King 90 1400 20 90 1800 South San Francisco Kochhar 1500 50 1500 Seattle De Haan 90 1700 60 1400 60 1800 Toronto Hunold 80 2500 2500 Oxford Ernst 60 90 1700 Lorentz 60 110 1700 Mourgos 50 190 1700 Rajs 50 Davies: 50 8 rows selected. 50 Matos 50 Vargas Zlotkey 80 Abel 80 Taylor 80

 To join n tables together, you need a minimum of n-1 join conditions. For example, to join three tables, a minimum of two joins is required.

# Non-Equijoins

#### **EMPLOYEES**

LAST_NAME	SALARY
King	24000
Kochhar	17000
De Haan	17000
Hunold	9000
Ernst	6000
Lorentz	4200
Mourgos	5800
Rajs	3500
Davies	3100
Matos	2600
Vargas	2500
Zlotkey	10500
Abel	11000
Taylor	8600

• • •

20 rows selected.

### JOB GRADES

GRA	LOWEST_SAL	HIGHEST_SAL
Α	1000	2999
В	3000	5999
С	6000	9999
D	10000	14999
E	15000	24999
F	25000	40000

Salary in the EMPLOYEES table must be between lowest salary and highest salary in the JOB\_GRADES table.

# **Retrieving Records with Non-Equijoins**

```
SELECT e.last_name, e.salary, j.grade_level
FROM employees e, job_grades j
WHERE e.salary
BETWEEN j.lowest_sal AND j.highest_sal;
```

LAST_NAME	SALARY	GRA
Matos	2600	А
Vargas	2500	А
Lorentz	4200	В
Mourgos	5800	В
Rajs	3500	В
Davies	3100	В
Whalen	4400	В
Hunold	9000	С
Ernst	6000	С

. . .

## **Outer Joins**

#### **DEPARTMENTS**

DEPARTMENT_NAME	DEPARTMENT_ID
Administration	10
Marketing	20
Shipping	50
IT	60
Sales	80
Executive	90
Accounting	110
Contracting	190

8 rows selected.

#### **EMPLOYEES**

DEPARTMENT_ID	LAST_NAME
90	King
90	Kochhar
90	De Haan
60	Hunold
60	Ernst
60	Lorentz
50	Mourgos
50	Rajs
50	Davies
50	Matos
50	Vargas
80	Zlotkey

• • •

20 rows selected.

There are no employees in department 190.

# **Outer Joins Syntax**

- You use an outer join to also see rows that do not meet the join condition.
- The Outer join operator is the plus sign (+).

```
SELECT table1.column, table2.column
FROM table1, table2
WHERE table1.column(+) = table2.column;
```

```
SELECT table1.column, table2.column
FROM table1, table2
WHERE table1.column = table2.column(+);
```

# **Using Outer Joins**

```
SELECT e.last_name, e.department_id, d.department_name
FROM employees e, departments d
WHERE e.department_id(+) = d.department_id;
```

LAST_NAME	DEPARTMENT_ID	DEPARTMENT_NAME
Whalen	10	Administration
Hartstein	20	Marketing
Fay	20	Marketing
Mourgos	50	Shipping
Rajs	50 Shipping	
Davies	50 Shipping	
Matos	50	Shipping
Gietz	110	Accounting
		Contracting

# **Self Joins**

#### EMPLOYEES (WORKER)

EMPLOYEE_ID	LAST_NAME	MANAGER_ID
100	King	
101	Kochhar	100
102	De Haan	100
103	Hunold	102
104	Ernst	103
107	Lorentz	103
124	Mourgos	100

### EMPLOYEES (MANAGER

EMPLOYEE_ID	LAST_NAME
100	King
101	Kochhar
102	De Haan
103	Hunold
104	Ernst
107	Lorentz
124	Mourgos

MANAGER\_ID in the WORKER table is equal to EMPLOYEE ID in the MANAGER table.

# Joining a Table to Itself

	WORKER.LAST_NAME  'WORKSFOR'  MANAGER.LAST_NAME	
Kochhar works for King		
De Haan works for King		
Mourgos works for King		
Zlotkey works for King		
Hartstein works for King		
Whalen works for Kochhar		
Higgins works for Kochhar		
Hunold works for De Haan		
Ernst works for Hunold		
I -		

. . .

# **Joining Tables Using SQL: 1999 Syntax**

Use a join to query data from more than one table.

```
SELECT table1.column, table2.column
FROM table1
[CROSS JOIN table2] |
[NATURAL JOIN table2] |
[JOIN table2 USING (column_name)] |
[JOIN table2
ON(table1.column_name = table2.column_name)] |
[LEFT|RIGHT|FULL OUTER JOIN table2
ON (table1.column_name = table2.column_name)];
```

# **Creating Cross Joins**

- The CROSS JOIN clause produces the crossproduct of two tables.
- This is the same as a Cartesian product between the two tables.

```
SELECT last_name, department_name
FROM employees
CROSS JOIN departments ;
```

LAST_NAME	DEPARTMENT_NAME
King	Administration
Kochhar	Administration
De Haan	Administration
Hunold	Administration

# **Creating Natural Joins**

- The NATURAL JOIN clause is based on all columns in the two tables that have the same name.
- It selects rows from the two tables that have equal values in all matched columns.
- If the columns having the same names have different data types, an error is returned.

# **Retrieving Records with Natural Joins**

DEPARTMENT_ID	DEPARTMENT_NAME	LOCATION_ID	CITY
60	IT	1400	Southlake
50	Shipping	1500	South San Francisco
10	Administration	1700	Seattle
90	Executive	1700	Seattle
110	Accounting	1700	Seattle
190	Contracting	1700	Seattle
20	Marketing	1800	Toronto
80	Sales	2500	Oxford

# **Creating Joins with the USING Clause**

- If several columns have the same names but the data types do not match, the NATURAL JOIN clause can be modified with the USING clause to specify the columns that should be used for an equijoin.
- Use the USING clause to match only one column when more than one column matches.
- Do not use a table name or alias in the referenced columns.
- The NATURAL JOIN and USING clauses are mutually exclusive.

# Retrieving Records with the USING Clause

```
SELECT e.employee_id, e.last_name, d.location_id
FROM employees e JOIN departments d
USING (department_id) ;
```

	EMPLOYEE_ID	LAST_NAME	LOCATION_ID
1	200	Whalen	1700
	201	Hartstein	1800
	202	Fay	1800
	124	Mourgos	1500
	141	Rajs	1500
	142	Davies	1500
	143	Matos	1500
	144	Vargas	1500
	103	Hunold	1400

<sup>19</sup> rows selected.

# **Creating Joins with the ON Clause**

- The join condition for the natural join is basically an equijoin of all columns with the same name.
- To specify arbitrary conditions or specify columns to join, the ON clause is used.
- The join condition is separated from other search conditions.
- The ON clause makes code easy to understand.

# Retrieving Records with the ON Clause

EMPLOYEE_ID	LAST_NAME	DEPARTMENT_ID	DEPARTMENT_ID	LOCATION_ID
200	Whalen	10	10	1700
201	Hartstein	20	20	1800
202	Fay	20	20	1800
124	Mourgos	50	50	1500
141	Rajs	50	50	1500
142	Davies	50	50	1500
143	Matos	50	50	1500

- - -

# Creating Three-Way Joins with the ON Clause

```
SELECT employee_id, city, department_name
FROM employees e
JOIN departments d
ON d.department_id = e.department_id
JOIN locations l
ON d.location_id = l.location_id;
```

EMPLOYEE_ID	CITY	DEPARTMENT_NAME
103	Southlake	IT
104	Southlake	ΙΤ
107	Southlake	IT
124	South San Francisco	Shipping
141	South San Francisco	Shipping
142	South San Francisco	Shipping
143	South San Francisco	Shipping
144	South San Francisco	Shipping

. . .

### **INNER Versus OUTER Joins**

- In SQL: 1999, the join of two tables returning only matched rows is an inner join.
- A join between two tables that returns the results of the inner join as well as unmatched rows left (or right) tables is a left (or right) outer join.
- A join between two tables that returns the results of an inner join as well as the results of a left and right join is a full outer join.

### LEFT OUTER JOIN

SELECT e.last\_name, e.department\_id, d.department\_name FROM employees e

LEFT OUTER JOIN departments d
ON (e.department\_id = d.department\_id);

LAST_NAME	DEPARTMENT_ID	DEPARTMENT_NAME
Whalen	10	Administration
Fay	20	Marketing
Hartstein	20	Marketing
De Haan	90	Executive
Kochhar	90	Executive
King	90	Executive
Gietz	110	Accounting
Higgins	110	Accounting
Grant		

### RIGHT OUTER JOIN

```
SELECT e.last_name, e.department_id, d.department_name
FROM employees e
RIGHT OUTER JOIN departments d
ON (e.department_id = d.department_id);
```

LAST_NAME	DEPARTMENT_ID	DEPARTMENT_NAME
King	90	Executive
Kochhar	90	Executive
Whalen	10	Administration
Hartstein		Marketing
Fay	20	Marketing
Higgins	110	Accounting
Gietz	110	Accounting
		Contracting

### FULL OUTER JOIN

```
SELECT e.last_name, e.department_id, d.department_name
FROM employees e

FULL OUTER JOIN departments d
ON (e.department_id = d.department_id);
```

LAST_NAME	DEPARTMENT_ID	DEPARTMENT_NAME
Whalen	10	Administration
Fay	20	Marketing
De Haan	90	Executive
Kochhar	90	Executive
King	90	Executive
Gietz	110	Accounting
Higgins	110	Accounting
Grant		
		Contracting

<sup>21</sup> rows selected.

In this lesson, you should have learned how to use joins to display data from multiple tables in:

- Oracle proprietary syntax for versions 8i and earlier
- SQL: 1999 compliant syntax for version 9i onwards
- Types of Joins
  - Equijoins
  - Non-equijoins
  - Outer joins
  - Self joins
  - Cross joins
